Sun Valley General Improvement District Service Line Inventory

The United States Environmental Protection Agency issued revisions to the federal Lead and Copper Rule on January 15, 2021. Revisions to the Rule are intended to better protect communities from lead exposure. Part of this Rule requires that public water systems create an inventory of water service lines in their system, identifying service lines as “Lead, Non-Lead, or Galvanized Requiring Replacement” by October 16, 2024. Public water systems would then use that inventory to develop a service line replacement plan for any lead service lines or galvanized lines that are downstream from any lead service lines.

Sun Valley General Improvement District has completed the service line inventory requirement of the new Lead and Copper Rule. Methods of identification included verifying records & details for each service address, verifying the date of installation, and excavating on District and customer’s side of meters for the unknowns. We are happy to announce that all water service lines have been identified as Non-Lead and no replacements will be required.
